Abstract

Banana plants in Indonesia can grow well both high and lowland, from the temperate wet and dry climate. In addition to the consumption of fresh banana in Indonesia a few cultivars are also widely used as industrial raw material chips, “sale pisang” and banana flour. Many craftsmen who developed food banana in the form of sale due to ease in the manufacturing process, in addition to food enthusiasts sale high enough banana. Making banana sale in the domestic industrial scale is still mostly done by hand which is only capable of producing 20 kg/hour in the form of processed banana fruit in banana sale. So many craftsmen maker banana sale household scale industries can not buy banana in large numbers. In the manufacture of sale of banana is done manually are still many shortcomings, which measure the thickness of the sale of banana produced uneven.

In general, pressing machine banana sale is a tool that changes the shape of banana from thick to thin size. By utilizing the roll rotation that drives the conveyor belt top and conveyor belt bottom of the moving direction. In this study is designed pressing sale banana tool driven electric motor with power 2 hp 1 phase with a speed of 1400 rpm. With a shaft diameter of 25 mm, the size of the pegs 10x22 mm with a depth of 5 mm. Gear is used in this reduction type where a large number of gear as much as 115 teeth, gear motor driver as much as 9 teeth and roll gear driver as much as 15 teeth. Bearings used in the manufacture of this pressing banana sale tool is bearing 6305 ZZ C3 P6 type.

Resulting of test manufacturing pressing banana sale tool conducted showed that the pressing machine capable flattens banana sale with an average size of 10.16 cm in length banana sale, with 3.3 cm and 0.36 cm thick with a capacity of 90 Kg/hour or in day (7 hour) machine capable of pressing flattens banana sale much as 630 Kg/day.

**Keywords:** Banana plants, pressing, machine design,

INTRODUCTION

Background

Crop of Banana in Indonesia can grow well in lowland which have wet climate and also have dry climate. Its fruit present every time and not depend to season, its spreading area almost in all of Indonesia. Banana represent one of the pre-eminent fruit commodity in Indonesia. Banana crop production always occupy first position. Banana production most harvested from people field. Beside for fresh consumption, some banana variety in Indonesia are also exploited with industry of banana for example industry of banana chips, banana flour and fermented banana (FB) or Banana Sale (BS). Banana containing many mineral and vitamin of esensial which is very good for health. Development of banana commodity in Indonesia is fair enough, good to fulfilling request of domestic market and also world market. With amount of resident more than 200 million (BPS, 2010) in Indonesia, request of banana in domestic market not only limited
to fresh banana, quite a few request in the form of processed banana (flaky, FB, banana pasta). The Main Competitor state for Indonesia in exporting banana is Ekuador, Philipina, and Colombia. Province which represent one of the producer of biggest banana is Sumatra area with amount of banana production equal to 349,928 ton/year (Suyanti, 2008). Banana type which found many in area is banana type of ambon, raja sere, muli, kapas, lilin and mas.

With amount of high banana production from all farmer of banana many industrial house of making of banana sale sometimes not ready to buy banana of farmer in number which many that thing is because of is tardy of him process workmanship of banana sale. Tardy of him is process of banana sale because of worker of maker of banana sale still a lot use appliance manually or in making of banana sale still use hand for pressing of banana sale. By pressing process of banana sale have weakness that is low productivity level with result 20 kg/hour. This matter push researcher to design an appliance for pressing of banana sale with expected home industry scale later this appliance can quicker the process of banana sale so that can increase product in making of banana sale.

Objectives
1. To design appliance for pressing banana sale with capacities 90 Kg/hour,
2. To increase the production of banana sale in home industry.

MATERIALS AND METHOD

Type of research

Research type taken is design and making prototype of banana sale pressing machine and analysis the number of banana sale pressed by the pressing machine.

Time and research place

This research was conducted on 25 of April to 1st of August 2010 in workshop of countryside of Selapan, District Of Candipuro South of Lampung.

Variables

1. Tied Variable
   Tied variable at making of appliance of this banana sale is machine capacities in making banana sale (“Sale pisang”).

2. Free Variable
   Free variable at making of appliance of this banana sale is energy and rotation yielded by activator motor

3. Controlling Variable
   Variable in control [at] making of appliance of this banana sale [is] appliance form pressing of banana sale and raw material making of banana sale

4. Step of research
   Research step in making of machine pengepres of this banana sale divided to become some phase among others [done/conducted] activity step before designing pressing appliance of banana sale, ready [of] materials and appliance to make pressing machine of banana sale, data analysis and method intake of data.

5. Bibliography Study
   That is by studying and taking considerations of literatures related to problem of scheme, good in the form of book, media a period of/to, and source of from internet

6. Field Study
   Accurate directly process pengepressan of banana sale by manual or [do] not use machine.

7. Quantitative Analysis
   In this analysis of data elaborated in the form of clear numbers as according to usefulness, so that can give meaning to data. To get capacities of pressing machine of banana sale used by equation:

   \[ Q = \frac{M}{t} (kg / dtk) \]

   Where:
   \( Q = \) Capacities of machine pengepres of banana sale (kg/sec)
   \( M = \) Weight of banana sale to be processing (kg)
   \( t = \) Time used in pressing of banana sale (sec.)
RESULT AND DISCUSSION

In designing of pressing appliance of banana sale used equation of energy and torque (Sularso, 1997), to design axis, lounching and pad to be used. Electromotor which is used in scheme of pressing appliance of this banana sale is electromotor with power 2 HP, used 220 volt of voltage and 1400 rpm.

The gear system in this research showed in table 1.

<table>
<thead>
<tr>
<th>No</th>
<th>Name of gear</th>
<th>Diameter</th>
<th>Weight</th>
<th>Number of tooth in gear</th>
<th>Number of gear</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Gear of main motor</td>
<td>3 cm</td>
<td>0.2 kg</td>
<td>9</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>Main gear</td>
<td>30 cm</td>
<td>2 kg</td>
<td>115</td>
<td>1</td>
</tr>
<tr>
<td>3</td>
<td>Little gear</td>
<td>6.5 cm</td>
<td>0.3 kg</td>
<td>15</td>
<td>4</td>
</tr>
</tbody>
</table>

1. Operation Motor

By the data on table 1, the force available on each gear calculated by the equations below respectively.

\[ F_1 = (0.2 \text{kg}) \times (9.81 \text{m/s}^2) = 1.96 \text{N} \]

\[ F_2 = (2 \text{kg}) \times (9.81 \text{m/s}^2) = 19.62 \text{N} \]

\[ F_3 = (0.3 \text{kg}) \times (9.81 \text{m/s}^2) = 2.94 \text{N} \]

The torque as the result from force of all gear calculated as following.

\[ T = F_1 \times r_1 + F_2 \times r_2 + F_3 \times r_3 \]

\[ T = (1.96 \times 0.015) + (19.62 \times 0.15) + (2.94 \times 0.0325 \times 4) \]

\[ = 0.029 + 2.943 + 0.382 \]

\[ = 3.354 \text{kg.m} \]

\[ = 3354 \text{kg.mm} \]

The power from the motor calculated as following.

\[
P = \frac{2 \times \pi \times n \times T}{60} \]

\[
= \frac{2 \times 3.14 \times 1400 \times 3.354}{60} \]

\[ = 491.47 \text{Watt} \]

\[ = 0.491 \text{KW} \]

2. The Shaft

The plan of Power with corection factor 1.2 as following.

\[ P_d = f_c \times \text{xp} \]

\[ = 1.2 \times 1,492 \]

\[ = 1,790 \text{KW} \]

The shear stress as following.
$$\tau_a = \frac{\sigma_B \sqrt{f_1/xsf_2}}{1} = \frac{58}{(6,0 \times 3,0)} = 3,222$$

The allowable shear stress is 3.2 therefore:

$$\tau_{lb} \geq \frac{F}{bxd_l}$$

3.2 \geq \frac{268.32}{10 \times 8.38} \Rightarrow 3.2 \geq 3.2$$

The diameter of the shaft calculated as following:

$$d_s = \left[ \frac{5,1}{\tau_a} \left[ \frac{xk,xc,b \times T}{x} \right] \right]^{1/3}$$

$$d_s = \left[ \frac{5,1}{3,222} \times 1,5 \times 1,7 \times 3354 \right]^{1/3}$$

$$d_s = \left[ 1,582 \times 1,5 \times 1,7 \times 3354 \right]^{1/3}$$

$$d_s = 23,83 mm$$

According to table number 4 so 25 mm diameter with 600 mm long is suitable for this shaft.

3. The dowel

The tangential force calculated as following:

$$F = \frac{T}{d_s/2}$$

$$F = \frac{3354}{(25/2)} = \frac{3354}{12,5} = 268,32 kg$$

The shear stress calculated as following:

$$\tau_k = \frac{F}{bxd}$$

$$3,2 = \frac{268,32}{bxd}$$

By b value is 10 mm and so:

$$bxd = \frac{268,32}{3,2}$$

$$bxd = 83,85$$

$$l = \frac{83,85}{10} = 8,38 mm$$

By table number 5 is got that the dimension of the dowel is width b 10 mm, long l 22 mm and dept t, 5 mm respectively.

4. Ball bearing

The ball bearing used is. 6305 ZZ C3 P6 (Sularso, 1997).

6 expressing single line ball pad [of] path
in abbreviation from 03, where 3 external diameter showe 52 mm for the diameter of hole 25 mm.
05 meaning 05 x 5 = 25 mm, hole diameter
ZZ mean bersil 2
C3 [is] diffuseness of C3
P6 mean correctness class:

5. Gear
The Gear at scheme of pressing machine of this banana sale is diametrical gear, where for used by small gear of motor gear with amount of tooth 15 big gear and with amount of tooth counted 115.

6. Transmission chain
Transmission chain which [is] used [at] scheme of pressing appliance of this banana sale is enchaining type motor of F 10, with specification of from enchaining activator there are at Table 2:

<table>
<thead>
<tr>
<th>Name of part</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of chain</td>
<td>40 (one set)</td>
</tr>
<tr>
<td>Distance (P)</td>
<td>12,70 mm</td>
</tr>
<tr>
<td>Diameter of rol (K)</td>
<td>7,94 mm</td>
</tr>
<tr>
<td>Wide of rol (W)</td>
<td>7,95 mm</td>
</tr>
<tr>
<td>Diameter of pen chain (D)</td>
<td>3,97 mm</td>
</tr>
<tr>
<td>Distance between axis</td>
<td>200 mm</td>
</tr>
</tbody>
</table>

7. The Rotation of Axis

\[ i = \frac{z_1}{z_2} = \frac{9}{115} = 0,078 \]

where:

\[ n_1 = 1400 \times 0,078 \]
\[ = 109,2 \text{rpm} \]
\[ = 1,82 \text{rps} \]

8. Belt Conveyor
This belt conveyor made from rubber to keep banana sale to be clean.

Table 3. Belt Conveyor (upper part)

<table>
<thead>

9. Spacer of thickness
Spacer of thickness would arrange thick attenuate banana sale at the pressing time. This spacer attached at roll so that apart between roll can change according to the size wanted. This component is made from axis which is fill into roll and then bound to use bolt to framework.

10. The Dimension of Banana Sale pressing machine
The dimension of Banana Sale pressing machine presented in figure 1.

Fig. 7. The thickness of banana before pressing (blue) and after pressing (red)

Fig. 8. Time of pressing (second)

12. Capacity of pressing machine

\[ Q = \frac{M}{t} \]

or

\[ Q = (0.025\text{kg/sec}) \times (3600\text{sec}) = 90\text{kg/hour} \]

or

\[ Q = (90\text{kg/hour}) \times (7\text{hour/day}) = 630\text{kg/day} \]

Capacity of pressing banana sale by worker with hand only 140 kg/day and not so clean as by pressing machine respectively.

**CONCLUSION**

1. With result of conducting the examination showed that the capacities of pressing machine in making banana sale can produce 90 kg/hour or in one day (7 hour/day) yielding 630 kg/day.

2. Result of examination of showed that pressing machine of banana sale can press with length 10.5 cm, wide 3.5 cm and thick 0.4 cm.

3. The design of this pressing machine of this banana sale use equation of Sularso (1997) to determine axis diameter, ball bearing and dowel. The type ball bearing is 6305 ZZ C3 P6, axis diameter 25 mm and wide of dowel of equal to 10 mm, with length equal to 22 mm and deepness of dowel equal to 5 mm.
